# **BEST PRACTICES**

Proper tank maintenance and fuel handling helps ensure your fuel supply stays clean and fresh in your storage tank — and remains that way until it reaches your fuel system. By following the tips and information in this guide, you can avoid most common cold-weather problems, and ensure reliable travel through the most challenging season of the year.

Be mindful of these key issues before cold weather strikes, and keep your customers informed, too:

- The true measure of your diesel fuel's cold weather performance is measured by **operability, cloud point** (CP), **cold filter plugging point** (CFPP) and the **cetane number**.
- There is a proper way to blend diesel fuels, biofuels and fuel additives.
- Proper tank maintenance and fuel filtration is a critical step to ensure your customer's fuel operates at optimal levels.
- Fuel handling and tank maintenance must be done properly. You can avoid most common coldweather problems, and ensure reliable performance year-round.
- Proper use of cold flow improvers can extend operability of fuels by:
  - Changing the diesel fuel wax structure utilizing wax dispersants.
  - Dispersing wax, thus keeping wax crystals from congregating in the fuel.
- In order to understand fuel performance issues, a complete analysis of the fuel inside a storage tank is required; following the correct sequence and having the proper fuel sampling equipment is crucial.
- In the event of a winter fuels failure, it is essential to get as much information as possible by asking the proper questions and taking fuel samples for analysis.

**Kerosene Terminals** – Kerosene is available in St. Paul Park, Minn. and Coffeyville, Kan. Availability subject to physical outages, terminal maintenance, etc. \*Seasonally Enhanced \*\*Cenex Premium Diesel Additive †Winter Aid IV ‡Cold Flow Improver

## CENEX° WINTERIZED PREMIUM DIESEL FUELS

**Cenex® Wintermaster® Premium Diesel** is formulated with an operability of -30°F and a typical cold filter plugging point (CFPP) of -55°F. Cenex Wintermaster is specifically formulated for the demands of diesel powered equipment in the most extreme winter conditions.

**Cenex Roadmaster XL® and Ruby Fieldmaster® Seasonally Enhanced Premium Diesel** fuels are formulated for moderate climates and provide outstanding shoulder season flexibility. Cenex Seasonally Enhanced Premium Diesel Fuels deliver a cold filter plugging point (CFPP) of -25°F. **#1 Diesel with Cenex Premium Diesel Additive**\* is used to blend down your Cenex Premium Diesel tanks during transition from summer to fall/winter, helping ensure additives remain at proper levels. Ideal for blending down bulk tanks, retail fueling site tanks and customer storage tanks.

**Cenex Roadmaster XL and Ruby Fieldmaster with Winter Aid IV** contain de-icers and Wax Anti-Settling Agents (WASA) to help extend the operability of the fuel. The manifest from these terminals will reference WA IV.

Like all Cenex Premium Diesel fuels, our winter lineup meets the requirements for Cenex Total Protection Plan<sup>®</sup> (TPP) coverage in agricultural equipment.

\* Where Cenex Ruby Fieldmaster is available, TPP Warranty holders are required to utilize this product when blending with Cenex Ruby Fieldmaster for seasonal purposes. The use of an untreated #1 distillate with Cenex Ruby Fieldmaster may void your TPP warranty.

# CENEX<sup>®</sup> PREMIUM DIESEL FUELS FEATURES & BENEFITS CHART

| FEATURE                      | WHAT IT DOES  | HOW YOU BENEFIT  |
|------------------------------|---|--|
| INJECTION STABILIZER         | Addresses fuel oxidation problems in new engine<br>technology fuel injectors and prevents internal diesel<br>injector deposits (IDID) from forming deep inside high-<br>precision injectors.  | <ul> <li>Less filter and injector replacements in new<br/>engine technologies</li> <li>Less downtime and maintenance costs</li> </ul>  |
| DETERGENTS                   | Aggressive detergent components help fuel systems stay clean and performing at their optimum level.   | <ul> <li>Improved fuel efficiency (up to 5% better in comparison to a typical #2 diesel fuel)</li> <li>4.5% improved power</li> <li>Cleans injectors and prevents deposit buildup</li> <li>Maintains ideal injector spray pattern</li> </ul> |
| CETANE IMPROVER              | Cetane is a measure of diesel engine startability. The<br>higher the cetane number, the quicker the fuel will<br>ignite. Cenex <sup>®</sup> Premium Diesel Fuel has a typical<br>cetane number of 47-49.  | <ul> <li>Reduced strain on engines and electrical systems</li> <li>Less downtime and maintenance cost</li> <li>Quicker, more fuel-efficient starts</li> <li>Smoother running engines</li> <li>Better cold-weather starts</li> </ul>          |
| LUBRICITY IMPROVER           | Friction-reducing agents provide better protection against friction and wear on the fuel pump.  | <ul> <li>Protects moving parts from excessive wear</li> <li>Meets OEM fuel lubricity recommendations</li> </ul>  |
| DEMULSIFIERS                 | Demulsifiers help water separate from the fuel and<br>fall to the bottom of the tank which allows for easy<br>drainage and removal. This prevents unwanted<br>moisture from being carried through the fuel system<br>and reduces the volume of water entering the<br>combustion chamber.                              | <ul> <li>Easier removal of water from storage tank</li> <li>Less wear on injectors</li> <li>Fewer filter replacements</li> <li>Prevents algae formation in storage tanks</li> </ul>  |
| CORROSION<br>INHIBITORS      | Provides superior corrosion protection, preventing the formation of rust on metal parts.  | <ul> <li>Reduces downtime and repair costs</li> <li>Slows the natural degradation of diesel fuel caused<br/>by exposure to oxygen</li> <li>Prevents corrosion-caused leaks, blockages and<br/>breaks in metal parts</li> </ul>               |
| STORAGE STABILIZERS          | Reduces gum and varnish buildup and contains components to extend the storage life of diesel fuel.  | <ul> <li>Extends storage life of diesel fuel</li> <li>Tolerates temperature extremes</li> <li>Increases injector life and optimizes combustibility</li> </ul>  |
| WAX CRYSTAL<br>Modifiers*    | <ul> <li>Wax crystal modifiers change the size and shape of wax crystals, preventing them from bonding together.</li> <li>Wax crystals stay small enough to flow through the fuel filter</li> <li>They create a porous wax cake on the fuel filter, allowing continued fuel flow until the engine heats up</li> </ul> | <ul> <li>Significantly increased cold weather operability</li> <li>Reduced downtime</li> </ul>   |
| DE-ICERS*                    | Dramatically lower the point at which any water in the fuel system freezes.   | Fewer moisture-related problems  |
| WAX ANTI-SETTLING<br>AGENTS* | Reduce settling of wax crystals in vehicle tanks and<br>aboveground storage tanks, which clog filters and<br>other fuel system components.  | <ul> <li>Enhanced cold weather operability</li> <li>Reduced downtime</li> <li>Reduced maintenance costs</li> </ul>   |

\*Winter fuel additives are in Cenex<sup>®</sup> Wintermaster<sup>®</sup>, Cenex Roadmaster XL<sup>®</sup> – Seasonally Enhanced, and Ruby Fieldmaster<sup>®</sup> – Seasonally Enhanced fuels only.

# WINTER FUELS BASICS

### **CLOUD POINT AND OPERABILITY**

**The cloud point** is the temperature at which paraffin, which is naturally present in #2 diesel fuel, begins to form cloudy wax crystals. When the fuel temperature reaches the cloud point, these wax crystals flow with the fuel, and coat the filter element. This quickly reduces the fuel flow, starving the engine.

**Operability** — equipment still functioning (filters not plugged).

**Wax Anti-Settling Agents (WASA)** — reduce settling of wax crystals in vehicle tanks and aboveground storage tanks which are known to clog filters and other fuel system components.

## THE COLD FILTER PLUGGING POINT (CFPP)

The Cold Filter Plugging Point (CFPP) is the temperature when fuel will plug filters.

# #1 or Y grade fuel — Typically has a cloud point and CFPP of -40°F or lower.

- #1 made in the southern tier refineries typically has a cloud point of around -40°F.
- #1 made in the northern tier refineries typically has a cloud point of around -60°F.

# #2 or X grade fuel — Pipeline terminal specification for cloud point is typically around 14°F.

- #2 made in southern tier refineries typically has a cloud point of around 14°F.
- #2 made in northern tier refineries typically has a cloud point of around 6°F.

# Biodiesel — Biodiesel blends may have a negative impact on the cloud point of fuel.

- B2 and B5 impact is typically 2-6°F.
- B10 blends and higher may have a significant impact, 10° or more.

## ULTRA LOW SULFUR DIESEL FUEL (ULSD)

The structure of wax in ULSD is different than low sulfur diesel fuels.

The difference in wax structure leads to more wax dropping out more quickly. This is why ULSD is more difficult to treat with cold flow improvers and why some ULSD #1 doesn't reduce the cloud point of ULSD #2 fuels as readily.

Q. How can you tell if fuel has reached its cloud point?

A The fuel looks cloudy.

Fuel at cloud point

Fuel at cold filter plugging point

Fuel without a cold flow improver (CFI) and wax anti-settling agent (WASA)

# **PROPER BLENDING**

A primary cause of winter fuel-related problems are that tanks are not properly "blended down," meaning fuel has a higher operability than intended. Blending down a tank is done by adding #1 diesel fuel to #2 diesel fuel. This helps maintain cold weather flow characteristics, increasing the operability of fuel.

When blending down a tank, pay close attention to the amount of fuel in the tank — this is known as the "heel." It is also important to know your proper treat rate and be sure to calculate it accurately. Treat rates vary by region or climate; for more information, contact your Cenex<sup>®</sup> Representative.

## EXAMPLE 1

A 2,000 gallon tank has 700 gallons of #2 diesel remaining. The proper treat rate for the region is a 50% #1 and 50% #2 blend.

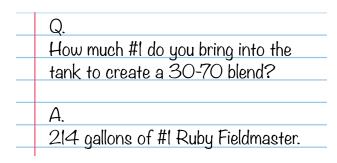

| Q.                                |
|-----------------------------------|
| How much would you bring into the |
| tank to create a 50–50 blend?     |
|                                   |
| A.                                |
| 700 gallons of #1 diesel.         |
| <br>J                             |

A common mistake, using the example above, is to bring in 700 gallons of a 50-50 blend and add it to the existing #2 fuel. That would result in a blend of 1,050 gallons of #2 and 350 gallons of #1 — or roughly a 71% #2 and 29% #1 blend.

### **EXAMPLE 2**

Blending Cenex Premium Diesel Seasonally Enhanced Fuel

A 2,000 gallon tank has 500 gallons of Ruby Fieldmaster<sup>®</sup> remaining. The proper treat rate for Cenex Premium Diesel Seasonally Enhanced Fuel is 30% #1 and 70% Ruby Fieldmaster.

## **EXAMPLE 3**

Blending Cenex Wintermaster® Premium Diesel Fuel

A 2,000 gallon tank has 500 gallons of Ruby Fieldmaster remaining. The proper treat rate for Cenex Wintermaster Fuel is 70% #1 and 30% Ruby Fieldmaster.

| Q.                                    |
|---------------------------------------|
| How much #1 do you bring into the     |
| tank to create a 70–30 blend?         |
|                                       |
| А.                                    |
| The first delivery should be 1,166    |
| gallons of # 1 Ruby Fieldmaster       |
| before bringing in terminally blended |
| Cenex Wintermaster fuel.              |

Rule of Thumb: Adding 10% #1 will typically reduce the cloud point of #2 fuel by 3 degrees.

## TIPS TO PROPERLY BLEND DOWN YOUR TANK:

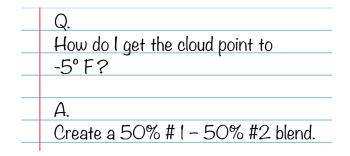

- If fuel in the tank is at or below its cloud point, biodiesel or cold flow additives will stratify or not blend into the fuel (causing filter plugging).
- Make sure fuel temperature is at least 10-15 degrees above cloud point before blending down.
- Adding 10% of #1 fuel typically reduces cloud point of fuel by 3 degrees.
- Note: Adding #1 fuel to a #2 fuel at or below its cloud point, or to fuel that is gelled, will not blend properly. The #1 fuel must be warm enough to raise the fuel temperature above the CFPP.

### **IMPACT OF CLOUD POINT**

When blending fuels, biofuels and additives, the cloud point of the fuel is very important. All components must be at least **10-15 degrees above their cloud point.** 

#### **EXAMPLE 1**

The cloud point of a #2 fuel is 10°F.

#### **EXAMPLE 2**

A customer is taking delivery of fuel to get him through fall harvest. The fuel is delivered in late November. The customer splash blends 2% biodiesel and a cold flow additive into the fuel. Is this a good idea?

| A.   |
|--|
| Dependent on the temperature of the        |
| fuel at the time, this can be a risky      |
| proposition. If the fuel in the tank is at |
| or below its cloud point, the biodiesel    |
| and the cold flow additive will not        |
| blend into the fuel or stratify. When      |
| biodiesel and cold flow additives are      |
| not properly blended into the fuel, they   |
| become another contaminate for fuel        |
| filters to pick up.                        |

## WINTER BLENDING WITH BIODIESEL

When blending into a storage tank that is a blend of fuel and biodiesel, you will need to add an additional 10% of #1 fuel to compensate for the increased cloud point of the biodiesel.

- Splash blending of neat biodiesel (B100) with petroleum diesel should occur when both products are 40°F or above.
- B2 or B5 biodiesel blends typically have very similar (within 0-5°F) cloud point and CFPP characteristics to conventional diesel products and can be treated in a similar fashion with #1 diesel blends, CFI, or both.
- Animal fat and higher level soy blends may increase the CFPP of the fuel as much as 5°F for every 10% of B100 used.
- Biodiesel may also have a negative impact on CFI response in blended fuel.

## AST (ABOVEGROUND STORAGE TANKS)

- Drain and remove all water and contaminants.
- □ Change filters and clean pump screens.
- Pre-blend #1 with existing fuel (blended above cloud point) as needed for your climate.
- Consider use of Winter Aid IV additive in existing fuels (packaged Winter Aid IV additive available from Lubricants department).

## **UST (UNDERGROUND STORAGE TANKS)**

- Remove all water and contaminants.
- □ Change filters and clean pump screens.
- □ Pre-blend #1 with existing fuel as needed for your climate.
- Consider use of Winter Aid IV additive in existing fuels (packaged Winter Aid IV additive available from Lubricants department).
- Underground temperatures, 35-45°F, will keep fuel above its cloud point.

# **COLD FLOW IMPROVERS**

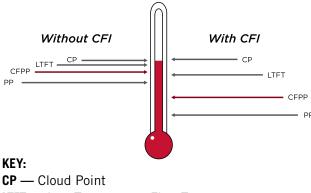

Cold flow improvers are designed to extend the operability of fuel by:

- Altering the diesel fuel wax structure utilizing wax dispersants.
- Dispersing wax thus keeping wax crystals from congregating in the fuel.

Cold flow additives do not reduce cloud point; using #1 diesel is the only way to reduce the cloud point of the fuel.

It is important not to rely on cold flow improvers to extend operability more than 15° below the fuel's cloud point (15 degrees delta).

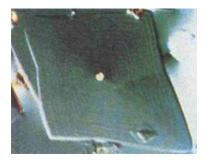

Using a cold flow improver (CFI) allows for operations at lower temperatures than that of unadditized/untreated fuel.

LTFT — Low Temperature Flow Test CFPP — Cold Filter Plugging Point PP — Pour Point

#### ALTERING THE WAX STRUCTURE OF DIESEL FUEL

Untreated diesel fuel wax structures are square in shape. As the fuel gets colder the wax structures get large enough to plug the fuel filters.

# DISPERSING WAX (WASA – WAX ANTI-SETTLING AGENTS)

Wax dispersants extend the operability by keeping wax crystals dispersed for long periods of time when fuels are stored below the fuel's cloud point.

Diesel fuel treated with a cold flow improver when the diesel fuel is 10 degrees above its cloud point will change the wax structure of the fuel to a pin-like structure. This allows the wax to pass through filters at colder temperatures (extending operability).

#### **Cold Flow Improvers:**

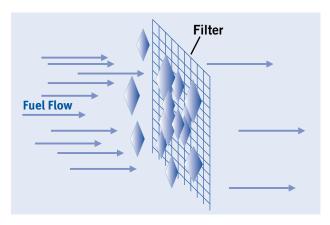

Additives that change the structure of the wax crystal, not the amount of wax. This allows the diesel fuel to operate at lower temperatures.

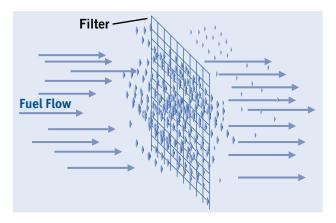

## **COLD FLOW IMPROVERS**

# COLD FLOW IMPROVERS – EXTENDING OPERABILITY WAX DISPOSITION ON FILTERS

**Without cold flow additive:** Diesel fuel structures will continue to grow as the fuel temperature decreases below the cloud point. As the fuel cools, the square-like wax structures get larger and eventually plug the filter not allowing fuel to pass through.

With cold flow additive: Diesel fuel with cold flow improver changes wax structure to a more pin-like structure. This change allows fuel to pass through the filter as the pin-like structures collect on the filter and pass through the filter more readily than square-like wax structures. This is what extends the operability of the fuel.

## Helpful Hint:

Replace fuel filters on storage and vehicle tanks; a waterlogged filter will swell and freeze, reducing the porosity and restricting fuel flow.

## **TANK MAINTENANCE**

Proper tank maintenance helps ensure your fuel supply stays clean and free of harmful contaminants in your storage tank — and remains that way until it reaches your fuel system. Removing water, sediment and other impurities from the storage tank prevents them from entering your fuel system where they can lead to corrosion, filter plugging, and ice formation that severely hampers engine performance.

#### WATER

Water gets into diesel fuel storage and vehicle tanks in several ways — by condensation of humid air, during transportation, by leakage through faulty fill pipes or vents and by careless handling. During fuel withdrawals, tanks can breathe in large volumes of humid air.

Water in the fuel can cause injector nozzle and pump corrosion, biological growth and fuel filter plugging with materials resulting from the corrosion or biological growth. In cold northern winters, ice formation in fuels containing water creates severe fuel line and filter plugging problems.

#### **Helpful Hint:**

Clean and drain water from storage tanks and equipment if you haven't already completed your fall tank maintenance.

**Oxidative Degradation** 

Biological Growth

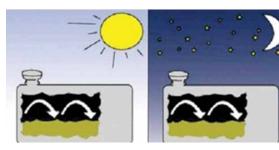

Particulates

# TANK MAINTENANCE

Managing the impact of water in your storage tanks is the foundation of proper tank maintenance. A significant amount of water in the tank will likely cause problems including oxidative degradation (rust, scale), particulates and microbiological growth. Follow these guidelines:

- Tilt tanks to direct water and debris away from the outlet.
- Pressurize tanks to keep vapor and air inside.
- Drain and remove all contaminates every three months (or as often as needed).
- Install proper filtration systems on bulk tanks (contact CHS Energy Equipment for more information – call 800-852-8186).
- Filters: All engine manufacturers equip their engines with fuel filters to protect the fuel system. You should replace these filters according to the manufacturer's recommendations. Some manufacturers also provide filters with drain valves and recommend periodic draining of any water that may accumulate from condensation and careless handling in storage or vehicle tanks.
- Clean pump screens regularly.
- Sample fuel for quality assurance purposes quarterly.
- Clean tanks annually.

Phase separation can happen when water is introduced to fuel. The biological growth live in the water and feed on the hydrocarbons (diesel fuel). The water and biological growth will eventually plug filters.

# FUEL SAMPLE STARTER KIT

## **APPLICATION**

- Portable hand-operated vacuum suction pump device is designed to determine fuel conditions present in fuel storage tanks.
- For use on underground and aboveground tanks for gasoline, diesel fuels, alcohol-blended fuels, as well as fuel oil tanks.
- Oil reservoirs and drums may also be tested.

## **DESIGN FEATURES**

- 6' x 14' polyurethane suction hoses with brass weights.
- Equipped with three shatter-proof sample containers.

### **BENEFITS**

- Collects more accurate samples than water finding paste.
- Case is portable, easy to store and impervious to decomposition caused by fuels.
- Kit is trouble-free and will work on any size tank.
- Metal container holder will keep samples from spilling.

Replacement Parts #90030 – Carrying Case #90218 – Shatter-proof Jar #90220 – Jar Lid

# FUEL SAMPLE KIT DIRECTIONS FOR USE

1. Attach brass weight to one end of the hose.

2. Attach the other end of the hose to the lid.

3. Attach jar to the lid.

4. Be sure to collect the sample from the bottom of the tank.

5. Pump sample into jar.

6. Send sample to Laurel lab (order sample kits from Lubes Customer Service). Be sure to fill out all paperwork including the Laurel lab information form.

#### Note:

The jar and hose must be cleaned with water or fuel and dried thoroughly between each sample.

# TROUBLESHOOTING

When an issue arises, the following information can help identify the source of the problem.

What was the fuel temperature at the time of the problem?

#### What terminal did the fuel come from?

| Was all fuel in the tank sourced from the same terminal? | 🗌 Yes | 🗌 No |
|--|-------|------|
| Was all fuel in the tank purchased                       |       |      |
| from the same supplier (i.e. CHS)?                       | 🗌 Yes | 🗌 No |

### What type of fuel is it?

|  | Cenex® | Ruby | Fieldmaster® |
|--|--------|------|--------------|
|--|--------|------|--------------|

|  | Cenex | Road | Imaster | XL® |
|--|-------|------|---------|-----|
|--|-------|------|---------|-----|

- Cenex Wintermaster®
- Cenex<sup>®</sup> #2
- Another supplier's fuel \_\_\_\_

## Is it a blend of #2 and #1? What percentage of #1 did you use? \_\_\_\_

Every 10% of #1 should reduce the cloud point of the fuel around 3 degrees.

# Was remaining fuel properly blended down, prior to bringing in winter fuel?

Customers need to account for the fuel that is already in the tank (bottoms included) when figuring out how to properly blend down tanks. If there is 1,000 gallons of #2 in the tank (including tank bottoms) then 1,000 gallons of #1 would need to be blended to create a 50-50 blend in the tank.

### Was the fuel blended with biodiesel? If so, what percentage?

Blends higher than B5 will increase the cloud point of the fuel.

Splash blended
 Terminal blended

# Has the customer splash blended a cold-weather additive or biodiesel?

Cold-weather additive

Biodiesel

Splash blending additives or biodiesel when *fuel* is at or below cloud point is not advised. Additive will likely not blend and fall out of solution leading to potential filter plugging problems.

#### Is the storage tank:

AbovegroundUnderground

#### Was a bottom sample taken from

the vehicle and storage tank?

Test kits can be ordered by calling 800-852-8186.

If filter plugging is the problem, the fuel sample must be taken before it reaches the filter.

| Was the filter | sent in? | Yes | 🗌 No |
|----------------|----------|-----|------|
|                |          |     |      |

Bottom samples are needed to determine if there are any contaminates in the tank.

When was the last time a bottom sample was taken from the tank to check for contaminates?

When was the last time the tank was cleaned?

### What type of vehicle was involved?

Make \_\_\_\_

Model \_\_\_\_

Type of filters used (paper, glass, etc.)

Filter porosity (2, 3 or 10 micron)

Are OEM-recommended filters being used?

🗌 Yes 🗌 No
